

FLANGED VALVES NOW PROTECTED WITH NYLON ADHESIVE RINGS

This product notice is to inform you that the serrated connection surface on all Kimray flanged valves will now come protected by a nylon adhesive ring.

The connection surfaces on flanged valves have a serration to them that is important for holding a gasket in place while the valve is connected to piping and installed, thus minimizing the risk of leakage.

Until now, Kimray has painted this surface along with the rest of the valve body, and customers typically have had to use a wire brush to clean the paint off the connection surface before installing the valve.

The new nylon adhesive rings add value by covering that connection before the valve is painted. This means the area will not be painted, and rather than cleaning paint from the surface, customers can simply peel off the adhesive ring and install the product.

The adhesive also comes with a VCI anti-corrosion additive that will provide additional protection for this serrated surface of the flanged valve.

This change will soon be effective on all flanged valves manufactured by Kimray.
